

Amazon Connect Agent Applications Fundamentals

Course Summary

In this course, you learned about Amazon Connect agent applications. Amazon Connect offers agents two out-of-the-box applications: Contact Control panel and Agent Workspace. You explored the benefits of agent applications, and learned about agents' experience using each application.

Benefits

- Scale operations while providing high quality voice: CCP delivers high quality real-time web communication (WebRTC) audio and video over an internet connection. This enables organizations to deliver excellent customer service without having agents tied to a traditional call center setup.
- Simplify agent operations with a unified agent experience: by integrating with internal and external applications, the Agent Workspace empowers agents to quickly resolve complex issues. Agents benefit from a unified view of customer information, AI powered recommendations and step-by-step guidance.
- Reduce handle time with contextual agent guidance: the Agent Workspace can automatically identify customer issues and recommend appropriate steps to solve them. It uses data available for the current contact to dynamically adapt and provide agent guidance.

Contact Control Panel (CCP)

The CCP is an application that allows agents to interact with customers. Within CCP, agents can dial, consult, transfer or conference calls, handle or transfer chats, or handle offline tasks related to customers.

Agents use a browser bookmark or a desktop shortcut to a URL link provided by their contact center administrator. This allows agents to work from home or from their organization's office.

The built-in CCP features include:

- Ability to handle interactions across any of the channels configured in the contact center.
- Ability to select an Available status from the agent status drop-down list.
- Configuration settings such as: log out, speaker, headphone, and microphone settings. Other settings include: redirecting the audio to a mobile device or desk phone and language settings.
- Quick Connects or pre-configured destination numbers that agents can use to dial or transfer interactions.
- Number Pad where agents can manually enter 10-digit external phone numbers. They can also send DTMF digits when interacting with an IVR system.

CCP integration and customization options:

- Large organizations often customize their CCP by integrating it with their customer system of record and other applications used by agents to address customer inquiries effectively.

Amazon Connect Agent Applications Fundamentals

Course Summary

- Developers can embed the built-in CCP widget into existing CRM web pages. By embedding the CCP widget, agents can access contact and status controls within the same workspace where they access customer data.
- For organizations that require simple call control functionality (Answer, Hold, Disconnect), developers can use Amazon Connect Streams to provide these controls without displaying the full CCP interface.

Agent Workspace

Agent Workspace integrates multiple Amazon Connect features into a single application, including:

- Contact Control Panel for interacting with customer contacts.
- Customer Profiles for viewing customer information.
- Cases for creating, updating, and resolving customer issues.
- Amazon Q in Connect for receiving recommendations and suggestions.
- Step-by-step guides for speeding up issue resolution.

Customer Profiles allows agents to view contact history and customer information from multiple data sources during the interaction.

Cases enable agents to create, track, and resolve customer issues that require multiple interactions across teams. It provides a unified view of each customer's issue, steps taken, and the outcome.

Amazon Q in Connect provides real-time agent assistance powered by generative AI, knowledge bases, and data sources. It displays suggested responses, recommended actions, and links to information sources based on the customer inquiry.

Amazon Connect Agent Applications Fundamentals

Course Summary

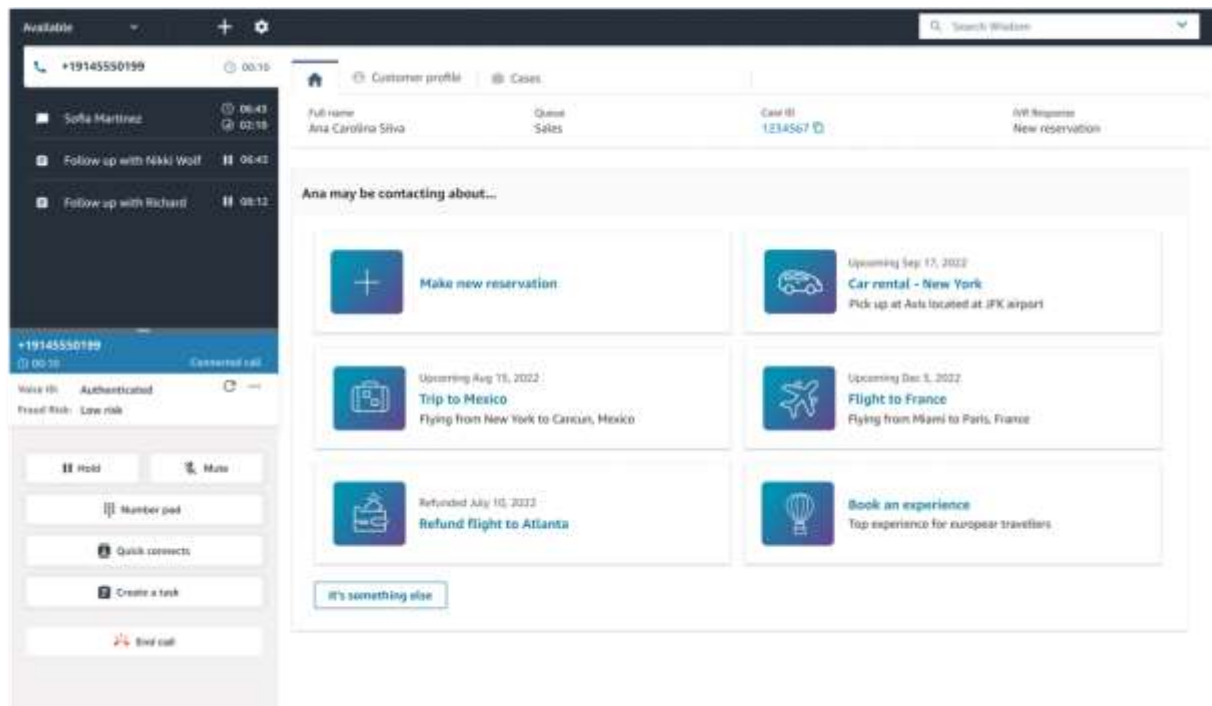

Step-by-step agent guides streamline agent workflows by providing guidance on how to handle or process next steps during customer interactions.

The Agent Workspace displays the following **customer data**:

- Customer profile data: contact information that allows agents to view and update customer details.
- IVR data: agents can view information collected during the IVR interaction, such as menu selections or chatbot intents.

The Agent Workspace provides the following **agent assistance**:

- Step-by-step guides: IVR designers can create workflows to display dynamic views suggesting actions for agents during customer interactions.
- Responses, recommendations, and information links. Using Contact Lens real-time contact intent identification, Amazon Q in Connect surfaces suggested responses, recommended actions, and relevant links. Agents can also manually search knowledge articles.

In addition to the built-in features of the Agent Workspace, organizations can integrate their homegrown or partner-built applications.

Course Summary

Considerations

There are a few considerations you should be aware of when using agent applications:

- **Security permissions:** organizations must implement proper security policies and permissions for their users based on roles and access levels required. Security profiles provide secure role-based access to specific areas of the Amazon Connect application. One of the required agent security permissions is access to CCP. Agents need this security permission to handle incoming contacts in CCP or Agent Workspace
- **Service quotas:** Administrators must verify and adjust service quotas as needed for Amazon Connect and related AWS services. Recommended quotas include Number of users per instance, Concurrent real-time calls with analytics, and Concurrent chat analytics jobs.
- **Pricing:** Amazon Connect has a flexible pricing model that allows scaling the number of users at no additional cost. However, organizations should carefully review and calculate the pricing of specific features and functionality they enable in agent workflows to avoid unexpected costs.
