

Building a Custom Contact Control Panel Fundamentals

Course Summary

Amazon Connect Streams (Streams)

Streams is a library that allows customization and integration of the Contact Control Panel (CCP) with other systems, such as customer relationship management (CRM). With Streams, developers can handle real-time data on agent and contact state events. They can programmatically control agent workflow, enabling the creation of a customized agent experience tailored to specific business requirements.

Benefits

Streams offers the following key benefits:

Consistent experience

- Maintain a unified user interface and experience across business applications.
- Facilitate seamless integration of communication channels such as voice and chat.
- Streamline agent training and enhance productivity with a consistent view.

Enhanced flexibility

- Support complete customization of the CCP interface.
- Allow integration of functionality tailored to specific business requirements.
- Provide control over the features, feel, integrations, and look of the CCP.

Simplified integration

- Facilitate integration with other systems and data sources.
- Display customer data and real-time updates within the CCP.
- Integrate business logic and connect to backend systems.

Built-in functionality

Streams provides built-in functionality through APIs such as the following:

- **Agent API:** With this API, you can subscribe to agent events such as state changes to available, offline, or unavailable. You will then receive notifications when the agent's state changes. You can also customize the user interface based on the agent's availability.
- **Connection API:** This API offers methods to handle the state of a connection in a contact. You can check the state of a contact connection. It also offers objects that are not persistent.
- **Contact API:** With this API, you can subscribe to contact events such as accepted, connecting, or ended. You will then receive notifications about incoming contacts and their states. It can also integrate with CRM systems to display relevant information.
- **Core API:** Using this API, you can initialize the Streams library and verify that the setup is correct for event listening. You can also embed the standard CCP in a webpage.

Building a Custom Contact Control Panel Fundamentals

Course Summary

Extended functionality

Streams supports extended capabilities that allow for advanced and customized integrations:

- Add a comprehensive view of customer information by using Amazon Connect Customer Profiles.
- Support agents with real-time recommendations to solve customer questions by using Amazon Q in Connect.
- Customize the chat experience within the agent interface by using ChatJS.
- Handle task contacts efficiently with the TaskJS APIs and events.
- Optimize audio quality when working with a VDI.

Security and best practices

Streams includes SAML authentication, and debugging and logging.

- Streams offers optional parameters for configuring SAML authentication. SAML authentication reduces credential management for agents through single sign-on.
- Download built-in logs programmatically or from the CCP interface to support debugging and logging. Write log entries to the browser's console by using Streams API methods.
